

## Exercises : Weighted Graphs

**Exercise 1** [Dijkstra] Apply the Dijkstra Algorithm to the graph depicted in Figure 1 to compute a shortest-path tree rooted in  $a$  and the distance between any vertex and vertex  $a$ . The first three steps of the algorithm must be detailed (**at most three or four lines per steps**). Moreover, indicate the order in which vertices are considered during the execution of the algorithm.

FIGURE 1 – A graph with 9 vertices. A number indicates the length of the arc it is close to.

**Exercise 2** [Minimum spanning trees vs. shortest path trees] Let  $d > 9$ .

Let us consider the following graph  $G = (V, E)$  with  $d + 1$  nodes  $V = \{v_0, v_1, \dots, v_d\}$  such that, for any  $1 \leq i \leq d$ , there is an edge with weight/length  $d$  from  $v_0$  to  $v_i$ , and, for any  $1 \leq i < d$ , there is an edge with weight/length  $i$  between  $v_i$  and  $v_{i+1}$ . Such a graph is depicted in Figure 2.

1. (2 points) Apply the Kruskal Algorithm on  $G$ . Explain how you proceed and what is the result that you obtain.
2. (1.5 points) Give  $d$  different minimum spanning trees of  $G$ .  
(*hint : consider the choices you had when applying the Kruskal Algorithm*)
3. (3 points) Let  $T$  be a spanning tree of  $G$  and let us assume that there are  $1 \leq i < j \leq d$  such that  $\{v_0, v_i\} \in E(T)$ ,  $\{v_0, v_j\} \in E(T)$  and, for any  $i < k < j$ ,  $\{v_0, v_k\} \notin E(T)$ . Show that  $T$  is not a minimum spanning tree of  $G$ .
4. (2 points) Prove that there are exactly  $d$  distinct minimum spanning trees in  $G$ .  
(*hint : use 2) and 3)*)
5. (\*) (4 points) Show that no spanning tree of  $G$  is a shortest-path tree. That is, for any minimum spanning-tree  $T$  of  $G$  and for any  $v \in V(G)$ ,  $T$  is not a shortest-path tree rooted in  $v$ .

(*hint : the fact that  $d > 9$  is important here*).

FIGURE 2 – A graph with  $d + 1$  vertices ( $d > 9$ ). A number indicates the weight/length of the arc it is close to.

**Exercise 3** [Modeling a problem as a shortest path problem in graphs] Four imprudent walkers are caught in the storm and nights. To reach the hut, they have to cross a canyon over a fragile rope bridge which can resist the weight of at most two persons. In addition, crossing the bridge requires to carry a torch to avoid to step into a hole. Unfortunately, the walkers have a unique torch and the canyon is too large to throw the torch across it. Due to dizziness and tiredness, the four walkers can cross the bridge in 1, 2, 5 and 10 minutes. When two walkers cross the bridge, they both need the torch and thus cross the bridge at the slowest of the two speeds.

With the help of a graph, find the minimum time for the walkers to cross the bridge.
